## 2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

BC_Linear	
Boundary conditions for linear boundary value problems	5
Blackbox	6
BoundaryCondition	
Abstract base class for boundary conditions $r(u,v)$ in boundary value problems $\ \ldots \ \ldots \ \ldots$	8
Curve	ć
Test::CurveStoer	ç
CurveTF	10
Test::CurveTroesch	11
DivFunctor	12
DOPRI54	
Butcher Tableau for the Dormand-Prince method of order 5(4)	13
DOPRI87	15
ERK< ButcherTableau >	
Solve an IVP of shape $u'(t)=f(t,u(t)), u(t_0)=u_0$ using an explicit Runge-Kutta method $\ \ .$	18
ERK_04	
Butcher Tableau for the classic Runge-Kutta method	20
ERK_Test_04	22
Euler	
Classic Euler method of order 1	22
FAD cWrapper< Callable >	
Class for equidimensional problems $f:\mathbb{R}^d o\mathbb{R}^d$ using AD $\dots\dots\dots\dots\dots\dots\dots\dots$	23
FAD_Setup< Callable >	
Class representing the time-dependent function with $n$ components $f:I imes\mathbb{R}^m o\mathbb{R}^n$	25
FAD_tWrapper< Callable >	
Class for equidimensional, time-dependent problems $f:I\times\mathbb{R}^d\to\mathbb{R}^d$ using AD	26
Functor	28
GnuPlot	
Plot output data with Gnuplot	28
KARP	
Butcher Tableau for the Cash-Karp method of order 5(4)	29
MultipleShooting	
Multiple shooting method for boundary value problems. Represented as a differentiable function	
$F:\mathbb{R}^d o\mathbb{R}^d$	31
Newton< Callable >	_
Newton method with globalization and rank-1 updates	33

4 Class Index

OneStepMethod	
Solve an IVP of shape $u'(t) = f(t, u(t)), u(t_0) = u_0$ using a one-step method	35
RK65	37
SF_Automatic< M, M_Var >	39
SF_External < M >	40
ShootingFunction	
Integrate an IVP $u^\prime=f(t,u)$ on a given time interval $[t_0,t_1]$ dependent on the initial value	
$s = u(t_0)$	41
SingleShooting	43
std_cWrapper< Callable >	44
std_tWrapper< Callable >	45
TimeDivFunctor	46
TimeFunctor	47

## **Chapter 3**

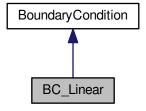

## **Class Documentation**

## 3.1 BC\_Linear Class Reference

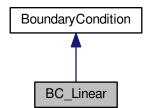

Boundary conditions for linear boundary value problems.

#include <boundary.h>

Inheritance diagram for BC\_Linear:

Collaboration diagram for BC\_Linear:

#### **Public Member Functions**

- BC\_Linear (MatrixD2 \_A, MatrixD2 \_B, VectorD2 \_c)
   Constructor
- virtual VectorD2 operator() (const VectorD2 &u, const VectorD2 &v) override
- virtual MatrixD2 diff\_u (const VectorD2 &, const VectorD2 &) override
- virtual MatrixD2 diff\_v (const VectorD2 &, const VectorD2 &) override

#### 3.1.1 Detailed Description

Boundary conditions for linear boundary value problems.

A linear BVP u'=f(t,u) has boundary condition r(u,v)=Au+Bv-c, where A and B are quadratic,  $n^2$ -dimensional matrices.

On the boundary of the interval I=[a,b], there holds r(u(a),u(b))=0. If n=2,  $A_1y(a)=c_1$  and  $B_2y(b)=c_2$ , we say the BVP is **separated**.

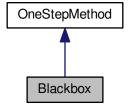

Most BVPs we consider are separated, for example the Thomas-Fermi or Troesch problems.

The documentation for this class was generated from the following file:

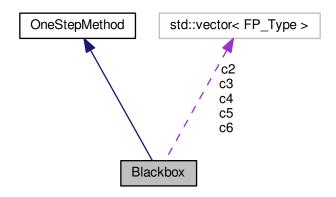

· bvp/boundary.h

## 3.2 Blackbox Class Reference

Inheritance diagram for Blackbox:

Collaboration diagram for Blackbox:

#### **Public Member Functions**

virtual dealii::Vector< FP\_Type > increment\_function (const FP\_Type t, const dealii::Vector< FP\_Type > &y, const FP\_Type h) override

#### **Public Attributes**

- const std::vector<  $FP_Type > c2 = \{ 1./5, 1./5 \}$
- const std::vector< FP\_Type > **c3** = { 3./10, 3./40, 9./40 }
- const std::vector< FP\_Type > c4 = { 4./5, 44./45, 56./15, 32./9 }
- const std::vector< FP\_Type > **c5**
- const std::vector< FP\_Type > c6
- const FP\_Type **s1** = 35./384
- const FP\_Type **s2** = 0.
- const FP\_Type **s3** = 500./1113
- const FP\_Type **s4** = 125./192
- const FP\_Type **s5** = 2187./6784
- const FP\_Type **s6** = 11./84

#### 3.2.1 Member Data Documentation

#### 3.2.1.1 c5

const std::vector<FP\_Type> Blackbox::c5

### Initial value:

```
= { 8./9, 19372./6561, 25360./2187, 64448./6561, 212./729 }
```

#### 3.2.1.2 c6

```
const std::vector<FP_Type> Blackbox::c6
```

#### Initial value:

```
= { 1., 9017./3168, 355./33,
46732./5247, 49./176, 5103./18656 }
```

The documentation for this class was generated from the following file:

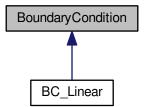

· test/test\_runge\_kutta.h

## 3.3 BoundaryCondition Class Reference

Abstract base class for boundary conditions r(u, v) in boundary value problems.

```
#include <boundary.h>
```

Inheritance diagram for BoundaryCondition:

#### **Public Member Functions**

- virtual VectorD2 operator() (const VectorD2 &u, const VectorD2 &v)=0
- virtual MatrixD2 diff\_u (const VectorD2 &u, const VectorD2 &v)=0
- virtual MatrixD2 diff\_v (const VectorD2 &u, const VectorD2 &v)=0

## 3.3.1 Detailed Description

Abstract base class for boundary conditions r(u,v) in boundary value problems.

Supports evaluation and differentation over u and v.

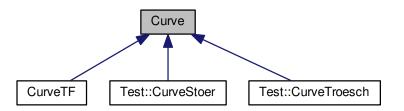

The documentation for this class was generated from the following file:

• bvp/boundary.h

3.4 Curve Class Reference 9

## 3.4 Curve Class Reference

Inheritance diagram for Curve:

## **Public Member Functions**

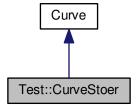

- Curve (size\_t n)
- virtual VectorD2 **operator()** (FP\_Type t)=0
- size\_t n\_dim () const

The documentation for this class was generated from the following file:

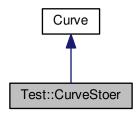

· lac/lac\_types.h

## 3.5 Test::CurveStoer Class Reference

Inheritance diagram for Test::CurveStoer:

Collaboration diagram for Test::CurveStoer:

## **Public Member Functions**

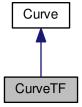

• VectorD2 **operator()** (FP\_Type t)

The documentation for this class was generated from the following file:

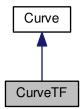

• test/test\_bvp.h

## 3.6 CurveTF Class Reference

Inheritance diagram for CurveTF:

Collaboration diagram for CurveTF:

## **Public Member Functions**

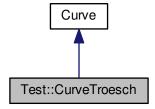

• VectorD2 **operator()** (FP\_Type t)

The documentation for this class was generated from the following file:

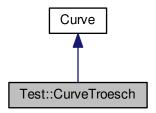

• multiple-shooting.cc

## 3.7 Test::CurveTroesch Class Reference

Inheritance diagram for Test::CurveTroesch:

Collaboration diagram for Test::CurveTroesch:

## **Public Member Functions**

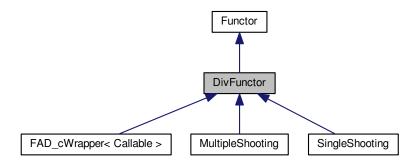

VectorD2 operator() (FP\_Type t)

The documentation for this class was generated from the following file:

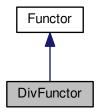

• test/test\_bvp.h

## 3.8 DivFunctor Class Reference

Inheritance diagram for DivFunctor:

Collaboration diagram for DivFunctor:

## **Public Member Functions**

virtual MatrixD2 diff (const VectorD2 &x)=0

The documentation for this class was generated from the following file:

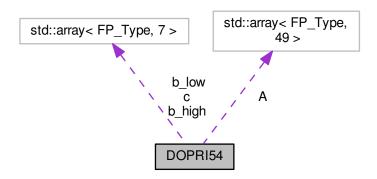

• lac/lac\_types.h

## 3.9 DOPRI54 Struct Reference

Butcher Tableau for the Dormand-Prince method of order 5(4).

#include <tableau.h>

Collaboration diagram for DOPRI54:

## **Public Attributes**

```
• const size_t n = 7
```

- const size\_t **p** = 4
- const std::array< FP\_Type,  $7 > \mathbf{c}$
- const std::array< FP\_Type, 49 > A
- const std::array< FP\_Type, 7 > b\_high
- const std::array< FP\_Type, 7 > b\_low

## 3.9.1 Detailed Description

Butcher Tableau for the Dormand-Prince method of order 5(4).

struct DOPRI54

#### 3.9.2 Member Data Documentation

#### 3.9.2.1 A

```
const std::array<FP_Type, 49> DOPRI54::A
```

### Initial value:

### 3.9.2.2 b\_high

```
const std::array<FP_Type, 7> DOPRI54::b_high
```

## Initial value:

```
= {
    35./384, 0, 500./1113, 125./192, -2187./6784, 11./84, 0
}
```

#### 3.9.2.3 b\_low

```
const std::array<FP_Type, 7> DOPRI54::b_low
```

#### Initial value:

```
= {
    5179./57600, 0, 7571./16695, 393./640, -92097./339200, 187./2100, 1./40
}
```

#### 3.9.2.4 c

```
const std::array<FP_Type, 7> DOPRI54::c
```

#### Initial value:

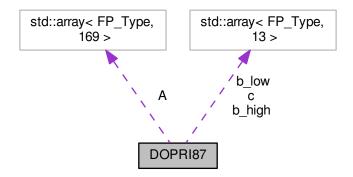

```
= {
    0, 1./5, 3./10, 4./5, 8./9, 1., 1.
}
```

The documentation for this struct was generated from the following file:

· ivp/tableau.h

## 3.10 DOPRI87 Struct Reference

Collaboration diagram for DOPRI87:

#### **Public Attributes**

- const size\_t **n** = 13
- const size  $t \mathbf{p} = 7$
- const std::array< FP\_Type, 13 > c
- const std::array< FP\_Type, 169 > A
- const std::array< FP Type, 13 > b\_high
- const std::array< FP\_Type, 13 > b\_low

#### 3.10.1 Member Data Documentation

#### 3.10.1.1 A

const std::array<FP\_Type, 169> DOPRI87::A

#### Initial value:

```
0.
                                                                   0,
                                                                                        0,
                                                                                                                                                                                              Ο,
                                                                                                                                                                                                                                                                Ο,

## 3.11.1 Detailed Description

```
template<typename ButcherTableau> class ERK< ButcherTableau>
```

Solve an IVP of shape  $u'(t) = f(t, u(t)), u(t_0) = u_0$  using an explicit Runge-Kutta method.

#### 3.11.2 Constructor & Destructor Documentation

#### 3.11.2.1 ERK()

#### ERK.

This constructor follows OneStepMethod. The used Butcher tableau is specified via a template parameter. Whether a method is embedded (for step-size control) is determined by checking if lower-order weights are available in the Butcher tableau.

Only fixed order methods or methods of order p+1, p are supported. See  $iterate\_with\_ssc$  for details.

#### 3.11.3 Member Function Documentation

#### 3.11.3.1 iterate\_with\_ssc()

iterate\_with\_ssc

#### **Parameters**

t_lim	
h0	
TOL	
С	Iteration function with support for step-size control. In each step, two solutions are computed, for order
Generated	թ $p$ րժայից $oldsymbol{a}$ nd $p$ respectively. Whether a step is accepted is then decided by computing an "optimal" step
	width. If the optimal width is smaller than the current value, the step is repeated using the new width.

More complex algorithms which choose method order dynamically (for example the KARP method for orders 1 to 5) are not implemented, but may be more suitable for discontinuous or rapidly changing ODEs. See the paper by Cash-Karp for details.

```
http://www.elegio.it/mc2/rk/doc/p201-cash-karp.pdf
```

When solving the variational equation, the step width is *only* determined by the initial-value problem. This approach may be improved by first solving the IVP with a *continuous* Runge-Kutta method. See the paper by L. Rández, 1990.

# 3.21 MultipleShooting Class Reference

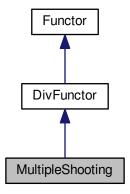

Multiple shooting method for boundary value problems. Represented as a differentiable function  $F: \mathbb{R}^d \to \mathbb{R}^d$ .

#include <methods.h>

Inheritance diagram for MultipleShooting:

Collaboration diagram for MultipleShooting:

## **Public Member Functions**

- MultipleShooting (ShootingFunction &\_M, std::vector< FP\_Type > \_t, BoundaryCondition &\_r)
- virtual VectorD2 operator() (const VectorD2 &s) override

Retrieve  $F_1(s_1, s_2), \dots, F_{m-1}(s_{m-1}, s_m), F_m(s_1, s_m)$  for the vector  $s = (s_1, \dots, s_m)$ .

• virtual MatrixD2 diff (const VectorD2 &s) override

Retrieve the matrix DF(s) for the vector  $s = (s_1, \dots, s_m)$ .

# 3.21.1 Detailed Description

Multiple shooting method for boundary value problems. Represented as a differentiable function  $F: \mathbb{R}^d \to \mathbb{R}^d$ .

See Stoer, Num. Math. 2, pp. 215.

## 3.21.2 Constructor & Destructor Documentation

#### 3.21.2.1 MultipleShooting()

Constructor. As SingleShooting, but a series of time points (interval subdivision) must be supplied.

#### 3.21.3 Member Function Documentation

```
3.21.3.1 diff()
```

Retrieve the matrix DF(s) for the vector  $s = (s_1, \dots, s_m)$ .

Blocks are implemented manually and through dealii::FullMatrix::add.

Implements DivFunctor.

#### 3.21.3.2 operator()()

```
virtual VectorD2 MultipleShooting::operator() (  {\tt const\ VectorD2\ \&\ s\ )} \quad [{\tt inline}] \text{, [override], [virtual]}
```

```
Retrieve F_1(s_1, s_2), \cdots, F_{m-1}(s_{m-1}, s_m), F_m(s_1, s_m) for the vector s = (s_1, \cdots, s_m).
```

Vector "blocks" are implemented manually.

Implements Functor.

The documentation for this class was generated from the following file:

bvp/methods.h

# 3.22 Newton < Callable > Class Template Reference

Newton method with globalization and rank-1 updates.

```
#include <newton.h>
```

#### **Public Member Functions**

- Newton (Callable \_f, size\_t \_dim, FP\_Type \_TOL=1e-6, bool \_ssc=true, size\_t \_ssc\_lim=20) Constructor. Initialize the method with a function  $f: \mathbb{R}^d \to \mathbb{R}^d$  of dimension d.
- void step (const MatrixD2 &J\_inv, VectorD2 &x)

Perform a Newton step.

• VectorD2 iterate (const VectorD2 &x0, size\_t step\_limit=25)

Perform Newton steps until ||f(s)|| < TOL.

VectorD2 iterate\_broyden (const VectorD2 &x0, size\_t skips=5, size\_t step\_limit=50)

Use rank-1 updates during iteration.

# 3.22.1 Detailed Description

```
template<typename Callable> class Newton< Callable >
```

Newton method with globalization and rank-1 updates.

This class implements the Newton method for finding the root of a non-linear equation  $f: \mathbb{R}^d \to \mathbb{R}^d$ . Step size control is available as globalization strategy (Def 4.2.3) in case a good initial guess of the root is not available.

## 3.22.2 Constructor & Destructor Documentation

## 3.22.2.1 Newton()

Constructor. Initialize the method with a function  $f: \mathbb{R}^d \to \mathbb{R}^d$  of dimension d.

The TOL parameter specifies when a root s is accepted. Step size control is activated by default; as the value j used within need not be bounded, the maximum may be set here (Remark 4.2.4).

#### 3.22.3 Member Function Documentation

#### 3.22.3.1 iterate()

Perform Newton steps until ||f(s)|| < TOL.

As the Jacobian is computed in this function, we assume that f is differentiable, i.e. has an available diff() method.

The maximum amount of steps may be specified, defaulting to 25. In our context, exceeding this limit has indicated either a program error or an unsuitably chosen method. Should this occur, the function therefore exits with an exception.

To solve the resulting linear systems, LU decomposition is used via dealii and LAPACK. The Jacobian that results from the multiple shooting method is sparse, but of small dimension in the problems we consider. (In particular, the Thomas-Fermi problem with 20 subintervals results in a  $40 \times 40$  Jacobian.)

#### 3.22.3.2 iterate broyden()

Use rank-1 updates during iteration.

The Jacobian is computed periodicially, as specified trough the skips parameter. This method converges slower, with the default step limit is chosen accordingly.

For **small problems** such as the Thomas-Fermi problem, the slow convergence rate was more expensive than computing the Jacobian in each step.

For **large problems**, the Sherman-Morrison formula may be used to update  $J^{-1}$  directly, instead of performing an LU decomposition. Due to lower relevance for small problems, this is not implemented here.

#### 3.22.3.3 step()

Perform a Newton step.

The Jacobian *inverse* is specifically taken as argument, to allow use of this function for both Newton and quasi-← Newton methods.

The documentation for this class was generated from the following file:

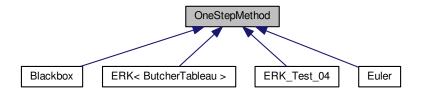

algo/newton.h

# 3.23 OneStepMethod Class Reference

Solve an IVP of shape  $u'(t) = f(t, u(t)), u(t_0) = u_0$  using a one-step method.

#include <eos\_method.h>

Inheritance diagram for OneStepMethod:

#### **Public Member Functions**

- template<typename BTab > class ERK

# 3.23.1 Detailed Description

Solve an IVP of shape  $u'(t) = f(t, u(t)), u(t_0) = u_0$  using a one-step method.

The common wrapped functionality includes collecting of intermediary computation results.

## 3.23.2 Constructor & Destructor Documentation

#### 3.23.2.1 OneStepMethod()

#### OneStepMethod.

#### **Parameters**

_f	Right-hand side of the ODE.	
_t0	Initial time value.	
_u0	Initial value, $u(t_0) = u_0$ .	
_var_eq	ar_eq If true, solve the variational equation.	
_u	Exact solution of the IVP.	

Solving the variational equation is done *simultaneously* with solving the IVP. In particular, the same step width is used for both problems. See the ERK documentation for further discussion.

A provided exact solution u(t) may be used to verify the local error at each time step. The involved constant are specified to the iteration methods.

# 3.23.3 Member Function Documentation

#### 3.23.3.1 print()

Print the approximate solution at each time step in a tabular format.

#### **Parameters**

File	stream to print to, for example stdout or an output file.
1 110	stream to print to, for example stdout or an output file.

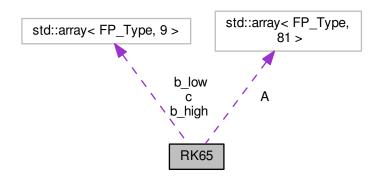

The documentation for this class was generated from the following file:

ivp/eos\_method.h

- virtual std::pair< VectorD2, MatrixD2 > solve\_Z (FP\_Type t0, FP\_Type t1, const VectorD2 &s) override Solve  $D_s y(t;t_0,s)$  in  $t=t_1$  by external differentation.

# 3.26.1 Member Function Documentation

#### 3.26.1.1 solve\_Z()

Solve  $D_s y(t; t_0, s)$  in  $t = t_1$  by external differentation.

For the choice of TOL in the adaptive method and the constant eps, see Stoer, Num. Math. 2, pp. 192.

Implements ShootingFunction.

The documentation for this class was generated from the following file:

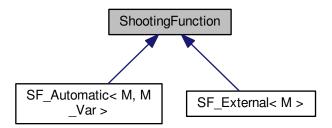

· bvp/shooting.h

# 3.27 ShootingFunction Class Reference

Integrate an IVP u' = f(t, u) on a given time interval  $[t_0, t_1]$  dependent on the initial value  $s = u(t_0)$ .

```
#include <shooting.h>
```

Inheritance diagram for ShootingFunction:

# **Public Member Functions**

- ShootingFunction (TimeFunctor &\_f, bool \_ssc=true, FP\_Type \_h0=1e-1, FP\_Type \_TOL=1e-4)
   Constructor.
- size\_t n\_dim () const

Return the dimension of F(s).

- virtual VectorD2 solve\_y (FP\_Type t0, FP\_Type t1, const VectorD2 &s)=0  $Solve\ y(t;t_0,s)\ in\ t=t_1.$
- virtual std::pair< VectorD2, MatrixD2 > solve\_Z (FP\_Type t0, FP\_Type t1, const VectorD2 &s)=0 Solve  $D_s y(t;t_0,s)$  in  $t=t_1$ .

#### **Friends**

```
    template<typename M >
        class SF_External
    template<typename M , typename N >
        class SF Automatic
```

# 3.27.1 Detailed Description

Integrate an IVP u' = f(t, u) on a given time interval  $[t_0, t_1]$  dependent on the initial value  $s = u(t_0)$ .

```
Notation: f(t, u(t; s)) or y(t; t_0, s).
```

The partial derivatives  $D_s f = \frac{\partial f}{\partial s}$  are computed approximatively (*external differentation*) or by solving the variational equation  $Y' = \nabla_u f(t,u(t))Y$ .

#### 3.27.2 Constructor & Destructor Documentation

## 3.27.2.1 ShootingFunction()

Constructor.

When disabling step-size control, the intial step width  $h_0$  should be set to a smaller value, for example 1e-3.

The appropriate value for TOL depends on the chosen method for differentiating F. For example, when computing DF with external differentiation, F should be integrated as accurately as possible.

#### 3.27.3 Member Function Documentation

# 3.27.3.1 solve\_Z()

```
virtual std::pair<VectorD2, MatrixD2> ShootingFunction::solve_Z (  \label{eq:fp_type_z} FP\_Type \ t0, \\ FP\_Type \ t1, \\ const \ VectorD2 \ \& \ s \ ) \ \ [pure \ virtual]
```

Solve  $D_s y(t; t_0, s)$  in  $t = t_1$ .

As solving  $D_s$  typically involves solving f, a pair of solutions is returned.

Implemented in SF\_Automatic< M, M\_Var >, and SF\_External< M >.

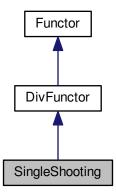

The documentation for this class was generated from the following file:

bvp/shooting.h

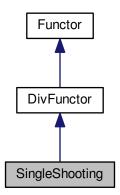

# 3.28 SingleShooting Class Reference

#include <methods.h>

Inheritance diagram for SingleShooting:

Collaboration diagram for SingleShooting:

## **Public Member Functions**

- SingleShooting (ShootingFunction &\_M, FP\_Type \_a, FP\_Type \_b, BoundaryCondition &\_r) Constructor for the single shooting method. Accepts any valid boundary condition r on a time interval [a,b].
- virtual VectorD2 operator() (const VectorD2 &s) override

Retrieve F(s) by solving the IVP y(b; s).

• virtual MatrixD2 diff (const VectorD2 &s) override  $\textit{Retrieve}\ DF(s).$ 

# 3.28.1 Detailed Description

Single shooting method for boundary value problems. Represented as a differentiable function  $F: \mathbb{R}^d \to \mathbb{R}^d$ .

See Stoer, Num. Math. 2, pp. 195.

## 3.28.2 Member Function Documentation

```
3.28.2.1 diff()
```

Retrieve DF(s).

DF may be derived in several ways:

- · Automatic differentation
- · Internal differentation
- · External differentation

Automatic and internal differentation imply solving the *variational equation*. See ShootingFunction for implemented methods.

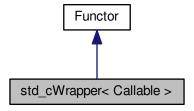

Implements DivFunctor.
